**Mahmoud Kamel Ali**

# Overview

## ❖ About System:

- An automated online exam system for Information Technology Institute.
- Efficient and scalable solution for managing online exams.

## ❖ Key Objectives:

- **Design and implement** a relational SQL database for exam management.
- **Store and manage** student records, exam details, and courses.
- **Develop stored procedures** for inserting, updating, and deleting data.
- **Automate exam creation and evaluation** for efficiency and accuracy.
- **Generate reports** on student performance and exam results.
- **Create Power BI dashboards** to visualize key metrics.

# Business & System Analysis

- A deep understanding of the business and system requirements was developed, leading to the design of the ITI Examination System and an efficient **ERD** model to optimize operations.

❖ **Static CRUD Stored Procedures**

❖ **Exam Stored Procedures:**

- Exam Generation
- Exam Answers
- Exam Correction

# Parameterized Dynamic SQL Stored Procedure

- ❑ Takes input parameters, dynamically constructs an SQL query, executes it, and handles errors using TRY...CATCH.

## SELECT

```
ALTER proc [dbo].[SelectFromTable] @t_name nvarchar(max) , @col nvarchar(max)='*' , @condition nvarchar(max)='1=1'
as
begin
    begin try
        execute('select '+@col+ ' from '+@t_name+ ' where '+@condition)
    end try

    begin catch
        select 'There is an error in your inputs'
    end catch
end
```

# Parameterized Dynamic SQL Stored Procedure

- ❑ Takes input parameters, dynamically constructs an SQL query, executes it, and handles errors using TRY...CATCH.

## Insert

```
ALTER proc [dbo].[InsertIntoTable] @t_name nvarchar(max) , @values nvarchar(max)
as
begin
    begin try
        execute('insert into '+@t_name+' values '+@values)
    end try
    begin catch
        select 'The is an error in your inputs'
    end catch
end
```

# Parameterized Dynamic SQL Stored Procedure

- ❑ Takes input parameters, dynamically constructs an SQL query, executes it, and handles errors using TRY...CATCH.

## Update

```
ALTER proc [dbo].[UpdateTable] @t_name nvarchar(max) , @the_update nvarchar(max) , @condition nvarchar(max)='1=1'
as
begin
    begin try
        execute('update '+@t_name+ ' set '+@the_update+ ' where '+@condition)
    end try

    begin catch
        select 'The is an error in your inputs.'
    end catch
end
```

# Parameterized Dynamic SQL Stored Procedure

- ❑ Takes input parameters, dynamically constructs an SQL query, executes it, and handles errors using TRY...CATCH.

## Delete

```
ALTER proc [dbo].[DeleteFromTable] @t_id nvarchar(max) , @condition nvarchar(max)='1=1'
as
begin
    begin try
        execute('delete from '+@t_id+' where '+@condition)
    end try
    begin catch
        select 'There is an error in your inputs.'
    end catch
end
```

# Static CRUD Stored Procedures

- ❑ Perform Create “Insert”, Read “Select”, Update, and Delete (CRUD) operations on a specific table with a predefined structure, using fixed queries.

## SELECT

```
ALTER proc [dbo].[SelectFromTrack] @track_id int =0
as
begin
    if @track_id =0
        select * from Track
    else
        begin
            if exists(select t_id from track where T_ID=@track_id)
                select * from track where t_id = @track_id
            else
                select 'Invalid Track ID.' as [Error Message]
        end
    end
end
```

# Static CRUD Stored Procedures

- ❑ Perform Create “Insert”, Read “Select”, Update, and Delete (CRUD) operations on a specific table with a predefined structure, using fixed queries.

## Insert

```
ALTER proc [dbo].[InsertIntoTrack] @name nvarchar(50) , @department_id int
as
begin
    if exists(select * from track where name=@name and D_ID = @department_id)
        select 'This track is already exists.' as [Error Message]
    else
        insert into Track values(@name , @department_id)
end
```

# Static CRUD Stored Procedures

- ❑ Perform Create “Insert”, Read “Select”, Update, and Delete (CRUD) operations on a specific table with a predefined structure, using fixed queries.

## Update

```
ALTER proc [dbo].[UpdateTrack] @track_id int , @new_name nvarchar(50) , @new_department_id int
as
begin
    if exists(select t_id from track where T_ID = @track_id)
    begin
        begin try
            update Track set [Name] = @new_name , d_id = @new_department_id where T_ID = @track_id
        end try
        begin catch
            select 'There is an error in updating' as [Error Message]
        end catch
    end
    else
        select 'Invalid Track ID.' as [Error Message]
end
```

# Static CRUD Stored Procedures

- ❑ Perform Create “Insert”, Read “Select”, Update, and Delete (CRUD) operations on a specific table with a predefined structure, using fixed queries.

## Delete

```
ALTER proc [dbo].[DeleteFromTrack] @track_id int
as
begin
    if exists(select T_ID from track where t_id=@track_id )
        begin
            begin try
                delete from track where T_ID = @track_id
            end try
            begin catch
                select 'There is an error in deleting.' as [Error Message]
            end catch
        end
    else
        select 'This id does not exists.' as [Error Message]
    end
end
```

# Reporting (SSRS)

- SSRS reports retrieve data using **SQL Stored Procedures**, ensuring optimized queries, parameterized filtering, and efficient report generation.

 **Student's Questions And Answers**

Question	S Answer
What is the main feature of Vue.js?	Reactive data binding
What is the main advantage of using Vue.js for frontend development?	JavaScript
Vue.js uses which language for templates?	HTML
Which directive is used for looping in Vue.js?	v-for
Vue components can communicate using:	Props and events
v-for is used for conditional rendering in Vue.js.	TRUE
Vue.js supports two-way data binding.	FALSE
Vue components must always have a single root element.	TRUE
Vue.js doesn't support conditional rendering.	FALSE
Vue Router is required for all Vue projects.	TRUE

```
Create proc show_qu @exam_id int , @stu_id int
